1. Welcome

Beedo-Trade is a Windows program that applies the Beedo technical-analysis course to Egyptian Exchange (EGX) stocks. You type a stock code, and it shows:

- **One signal** on the course ladder, from Confirm Sell to Confirm Buy
- **What to do** if you hold cash, and if you already own the stock
- **An interactive chart** with the moving averages, support and resistance lines, swing points, volume and RSI
- **The 11-step checklist**, with the evidence for every step
- **A trade plan** sized to your cash and risk
- **A watchlist** that scans all your stocks at once

What you need

Requirement	Details
Windows 10 or 11 (64-bit)	Any recent Windows PC.
Internet connection	To download daily prices. Each analysis takes a few seconds.
Microsoft Edge WebView2	Built into Windows 11 and most Windows 10 PCs. Setup tells you if it is missing.

> **IMPORTANT** **Not investment advice**
>
> Beedo-Trade is a learning and decision-support tool. It never places orders, and free price data can be delayed. Always check the live price and the day's EGX disclosures before trading.

2. Installing Beedo-Trade

1 **Download the installer**
Download **Beedo-Trade-Setup-1.4.0.exe** from the Releases page of github.com/BeedoElOmda/Beedo-Trade, or use the copy you were given.

2 **Open it**
Double-click the file. If Windows shows **"Windows protected your PC"**, click **More info**, then **Run anyway**. This appears because the app isn't code-signed; it is normal for small independent programs.

3 **Choose who to install for**
Pick **Install for me only (recommended)**. It needs no administrator password and installs into your user folder. Choose **Install for all users** only if several people use this PC: Windows will ask for administrator approval, and it installs into Program Files.

4 **Accept the notice**
Read the notice (not investment advice, plus the MIT license), select **I accept the agreement**, then **Next**.

5 **Keep the suggested folder**
Click **Next**. The suggested folder already matches your choice in step 3.

6 **Shortcuts and install**
Tick **Create a desktop shortcut** if you want one, then click **Install**.

7 **Finish**
Leave **Start Beedo-Trade now** ticked and click **Finish**. You can also open this guide from here.

> NOTE **Error "Access is denied" (Error 5) during setup**
> This happens when **Install for me only** is combined with a folder inside C:\Program Files, which only an administrator can write to. Setup now warns you before this can happen. Either keep the suggested folder, or start again and choose **Install for all users**.

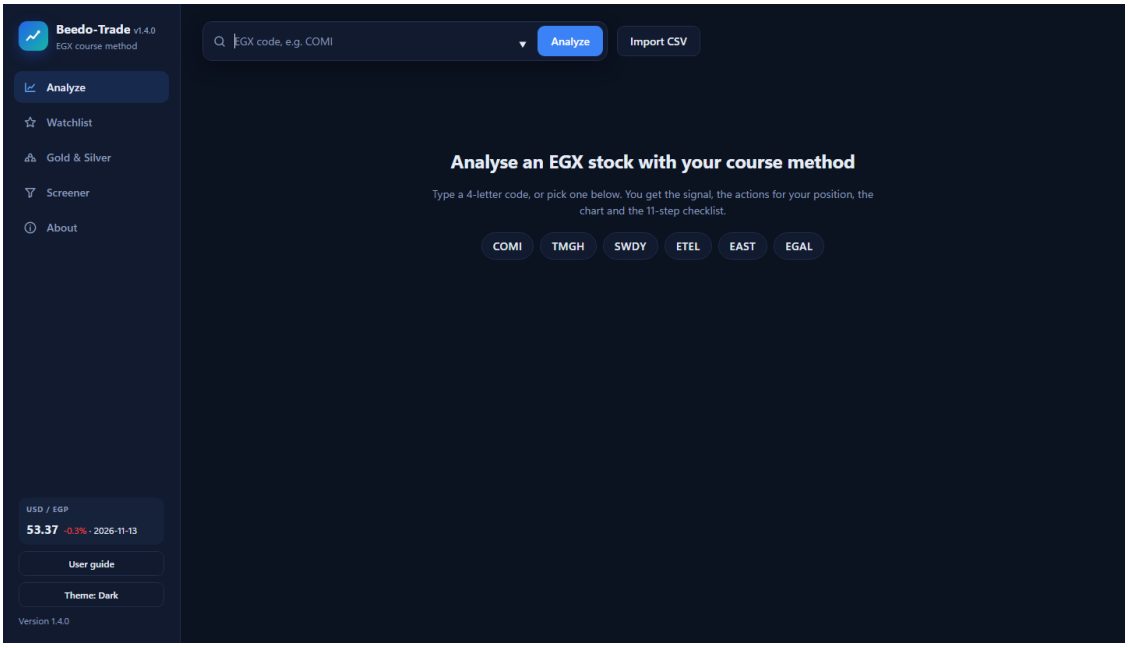

After installing you will find **Beedo-Trade**, **Beedo-Trade User Guide** and **Uninstall Beedo-Trade** in the Start menu. The first launch can take 10 to 20 seconds while Windows checks the new program; later launches are faster.

2.1 Installing on a Mac

1. Download the **.dmg** file for your Mac from the Releases page: **arm64** for Apple Silicon Macs (M1 and later), **x86_64** for Intel Macs. To check, open the Apple menu and choose About This Mac.

2. Open the .dmg and drag **Beedo-Trade** onto the **Applications** folder.
3. The first time, macOS blocks the app because it isn't signed by an Apple-registered developer. Open it once, close the warning, then go to **System Settings → Privacy & Security**, scroll down and click **Open Anyway**. On older macOS versions, right-click the app and choose **Open** instead.
4. To uninstall, drag Beedo-Trade from Applications to the Trash. Your settings are in **~/Library/Application Support/BeedoTrade**.

3. Your first analysis

The start screen: type a code or pick one of your watchlist stocks.

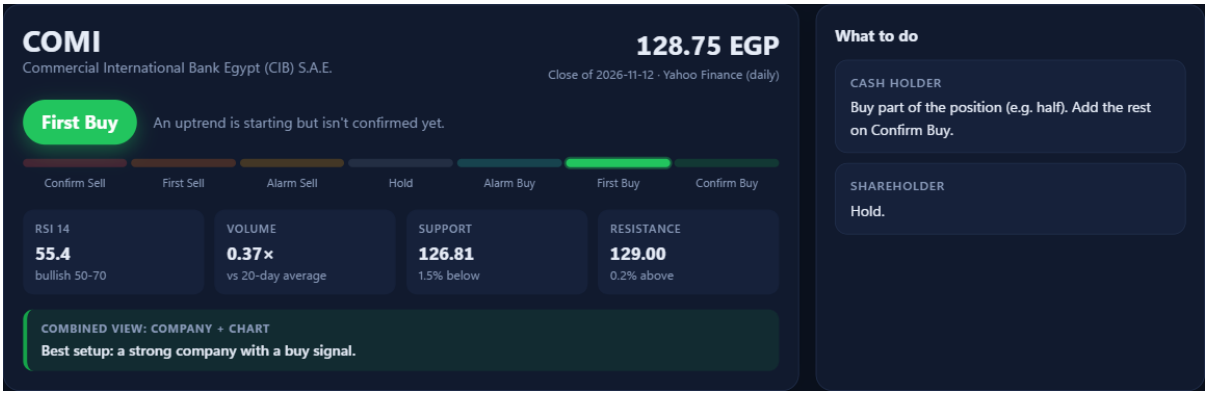

The left menu also shows the app's version next to its name, and the official **USD / EGP** rate with its change from the previous day.

1. Type an EGX code in the search box, for example **COMI**. Suggestions appear as you type.
2. Press **Enter** or click **Analyze**.
3. Read the result. **What to do** always shows the advice for both a **Cash holder** (you don't own the stock) and a **Shareholder** (you do).

> **TIP** **Use the 4-letter EGX code**
> For example COMI (CIB), TMGH (Talaat Moustafa), SWDY (Elsewedy), ETEL (Telecom Egypt), EAST (Eastern Company), EGAL (Egypt Aluminum).

4. Reading the result

4.1 The signal and what to do

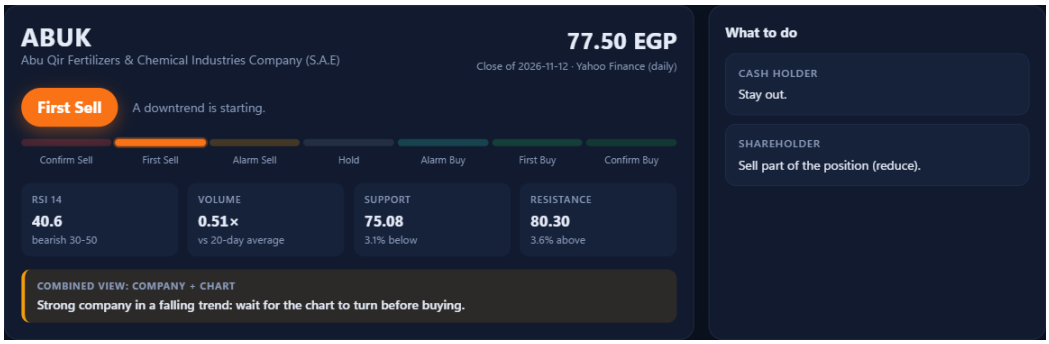

COMI: First Buy, with the actions for both positions, the key numbers and the combined view.

The coloured badge is the overall signal. The bar under it is the course's signal ladder, with your stock's position lit up:

Signal	Meaning	Typical action
Confirm Buy	Trend, moving averages, RSI and volume agree upward	Cash holder: buy the full position
First Buy	An uptrend is starting but isn't confirmed	Cash holder: buy part (e.g. half)
Alarm Buy	Early signs of a turn upward	Get ready, don't buy yet
Hold	No clear signal, or a sideways market	Stay as you are
Alarm Sell	Early signs of a turn downward	Shareholder: tighten your stop
First Sell	A downtrend is starting	Shareholder: reduce
Confirm Sell	Everything agrees downward	Shareholder: sell

The sentence next to the badge says why. When a signal is held back by a course rule (for example "price is still below MA18" or "the market is moving sideways"), it says so. The four boxes show **RSI**, today's **volume** against its 20-day average, and the nearest **support** and **resistance**. The **Combined view** at the bottom joins this signal with the company's fundamentals rating (section 6).

A sell example (ABUK, First Sell): each position gets its own advice.

4.2 Key figures

Key figures for COMI: the main financial ratios in five groups, plus the 52-week price range.

The Key figures panel shows the company's main financial ratios from its last 12 months of reported results:

Group	What it shows
Valuation	Market cap, P/E, P/B, price/sales, EV/EBITDA, earnings per share (EPS) and dividend yield
Profitability	Return on equity and on assets, and gross, operating and net margins
Financial health	Debt to equity, current ratio (short-term bills covered if above 1), total debt and free cash flow
Growth & size	Revenue and net income over 12 months, and their yearly growth
Price & risk	Performance over 1 month, 3 months, year to date and 1 year, beta, monthly volatility and average volume

The bar underneath shows where today's price sits between the 52-week low (left) and high (right). Hover over a figure for a short explanation. A dash (–) means the company hasn't reported that figure.

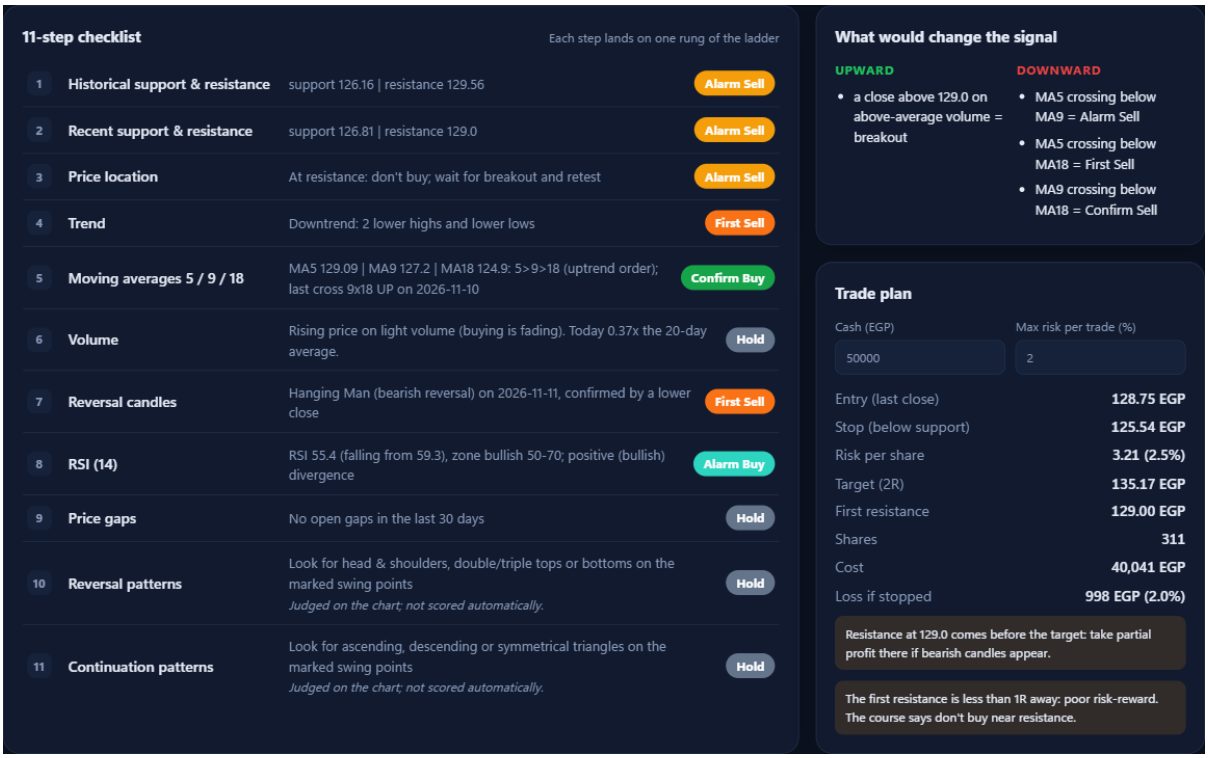

4.3 The chart

Candles with MA 5 / 9 / 18, support (S) and resistance (R) lines, swing arrows, volume and RSI.

- **Moving averages:** MA5 (pink), MA9 (yellow), MA18 (blue). The course's crossovers are 5×9 = Alarm, 5×18 = First, 9×18 = Confirm.
- **S1 / S2 and R1 / R2:** the nearest recent support (green) and resistance (red) levels.
- **Arrows:** swing highs (red, pointing down) and swing lows (green, pointing up). Use them to judge patterns such as head and shoulders, double tops or triangles (checklist steps 10 and 11).
- **RSI panel:** with the 30, 50 and 70 lines.
- **Controls:** scroll the mouse wheel over the chart to zoom, drag to move back in time, and use the tick boxes above the chart to show or hide each layer.

4.4 Checklist, triggers and trade plan

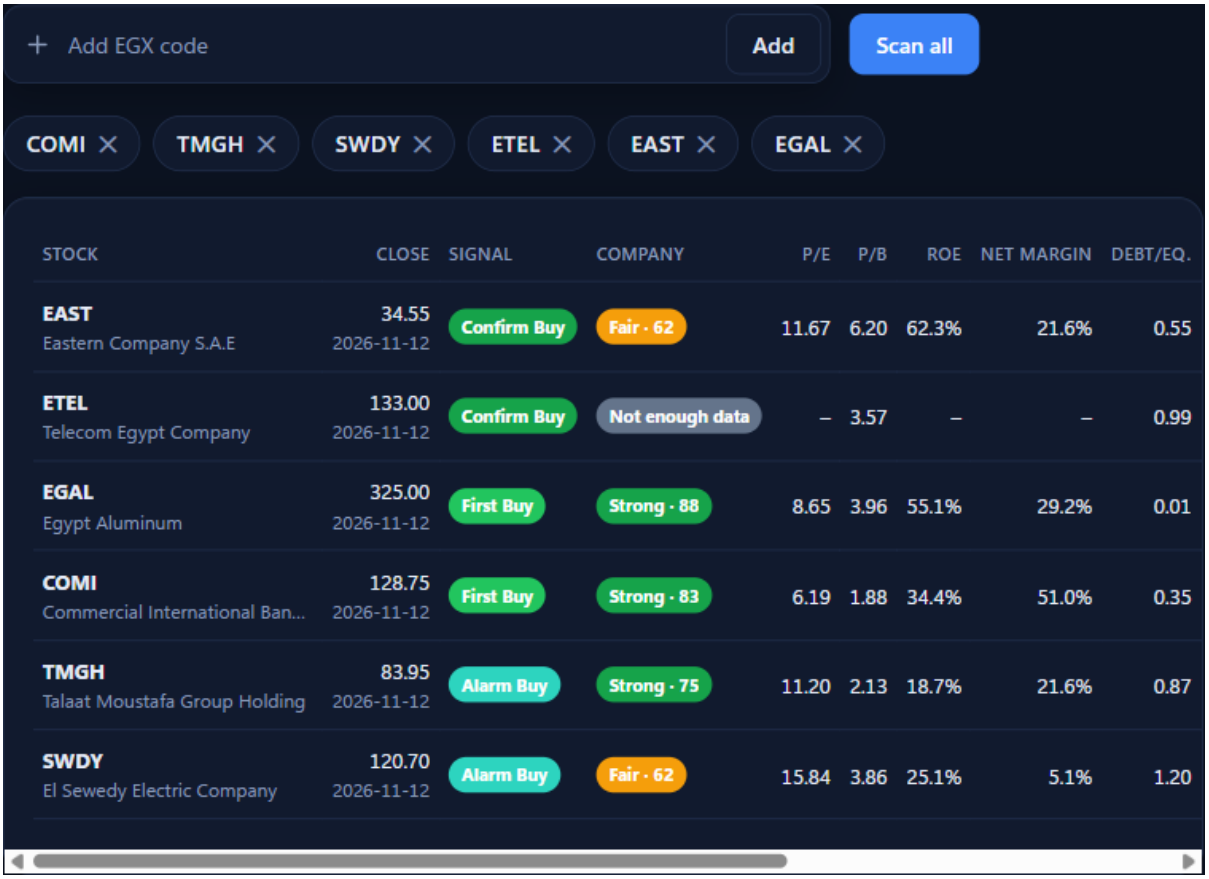

The 11-step checklist (left), what would change the signal, and the trade plan (right).

11-step checklist: each course step with its reading and its rung on the ladder. Steps 10 and 11 (chart patterns) are judged by you on the chart.

What would change the signal: the next events up and down, such as "MA9 crossing above MA18 = Confirm Buy" or "a close below 126.81 = support broken".

Trade plan: enter your cash and the most you are willing to lose per trade (default 2%). It shows the entry (last close), a stop just below support, a 2R target, the number of shares, the cost and the loss if the stop is hit. Yellow notes warn when resistance is in the way. On weaker signals the plan is labelled as one to have ready, not a trade for today.

5. Watchlist

The watchlist after "Scan all", strongest buy first.

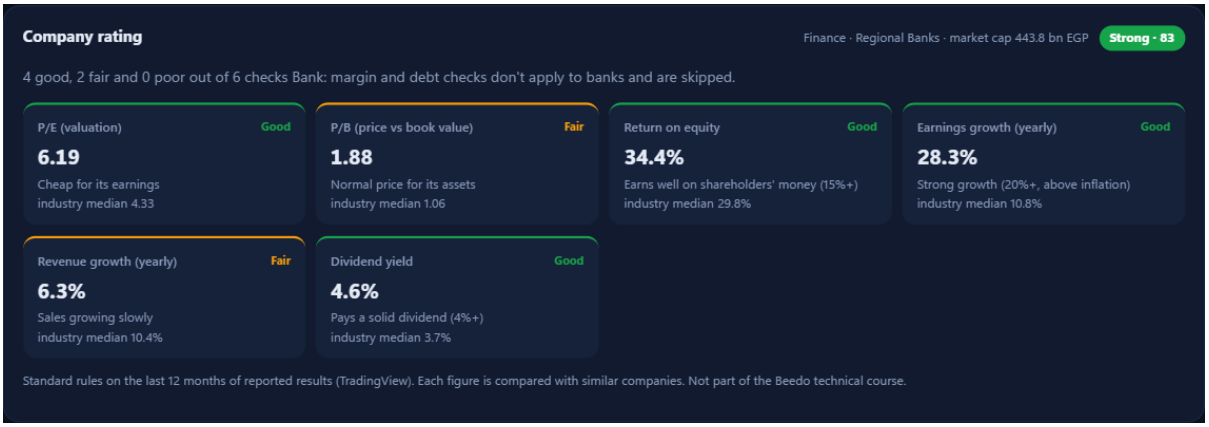

1. Open **Watchlist** in the left menu.
2. Type a code in **Add EGX code** and click **Add**. Remove a stock with the ✕ on its chip.
3. Click **Scan all**. Every stock is analysed and sorted from the strongest buy to the strongest sell, with each company's rating, its main ratios (P/E, P/B, ROE, net margin, debt/equity, EPS growth, dividend yield, market cap, year-to-date performance) and the combined view.
4. Click a column header to sort by it (click again to reverse). Click any row to open its full analysis.

Your watchlist is saved automatically and shown as quick-pick buttons on the start screen.

6. Company fundamentals and the Screener

Your course tells you when to buy or sell. Fundamentals tell you whether the company is worth owning at all. Beedo-Trade rates every company with standard rules, then combines that rating with the course signal.

6.1 The company rating card

COMI: rated Strong (83). Each tile shows the figure, its rating and the median of similar companies.

Each figure is rated Good, Fair or Poor, and shown next to the median of similar companies (same industry where possible, otherwise the same sector or the whole market):

Check	Good	Poor
P/E (valuation)	10 or less, or well below peers	Over 30, far above peers, or loss-making
P/B (price vs book)	1.5 or less (banks: 1.0)	Over 5 (banks: 2.5) and above peers
Return on equity	15% or more	Under 8%
Net profit margin	10% or more	Under 3%
Debt to equity	0.5 or less	Over 1.5
Earnings / revenue growth	20% or more a year	Falling
Dividend yield (bonus)	4% or more	No penalty for paying no dividend

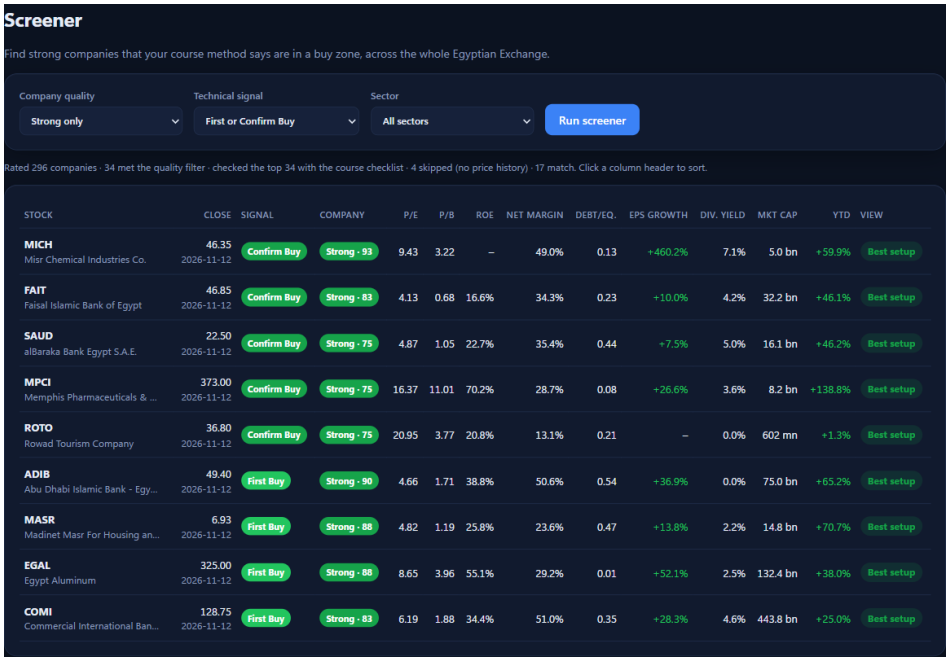

Overall rating: Strong (70 or more out of 100), Fair (45 to 69) or Weak (under 45). Banks skip the margin and debt checks, which don't fit how banks work. If fewer than three key figures are reported, the rating is **Not enough data**. This is common for smaller companies.

> **NOTE** **Why growth needs 20% to count as good**
> Egypt's high inflation lifts every company's sales and profits in pounds. Growth below inflation means the business is shrinking in real terms, so 20% a year is the bar for "Good".

6.2 The combined view

Company	Course signal	Combined view
Strong	First / Confirm Buy	Best setup: a strong company with a buy signal
Strong	Alarm Buy or Hold	Put it on your watchlist and wait for a buy signal
Strong	Any sell	Wait for the chart to turn before buying
Fair	First / Confirm Buy	Acceptable: consider a smaller position
Weak	First / Confirm Buy	Speculative: small size, or skip it
Weak	No buy signal	Avoid

6.3 The Screener

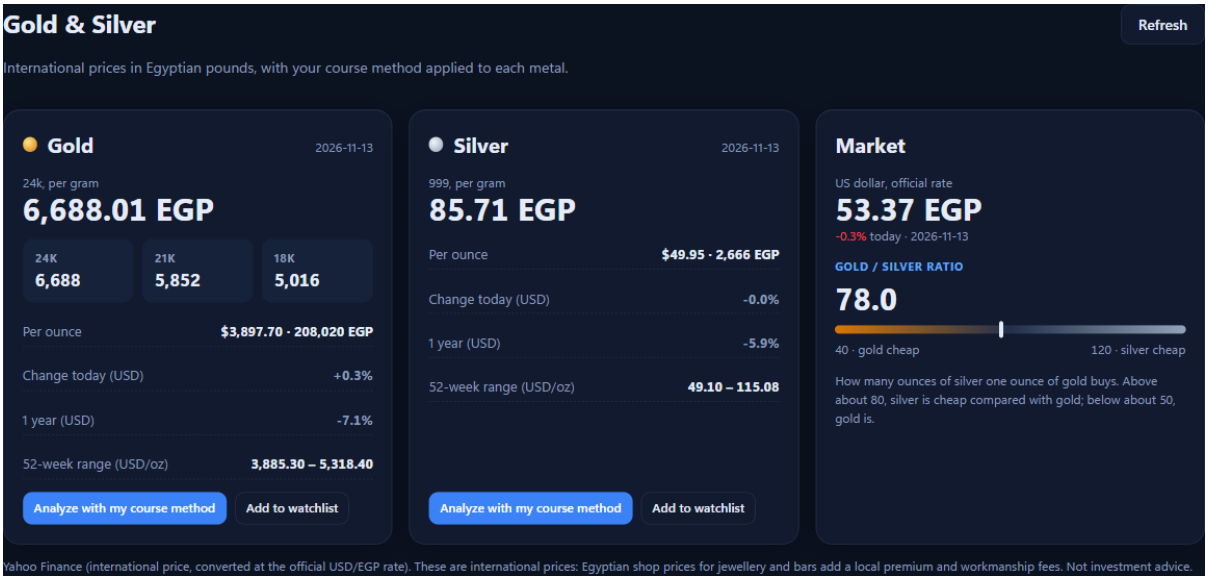

The Screener: strong companies that are in a buy zone right now.

1. Open **Screener** in the left menu.
2. Choose the **Company quality** (Strong only, or Strong or Fair), the **Technical signal** you want, and optionally a **Sector**.
3. Click **Run screener**. It rates every EGX company, then runs your course checklist on the best 40. This takes 10 to 40 seconds.
4. The results show the same ratio columns as the Watchlist. Click a column header to sort, for example by P/E or dividend yield. Hover over a row to read its full combined view, and click it to open the full analysis.

> **TIP** **Use the Screener to find ideas, then check them**
> The Screener narrows about 300 stocks to a short list. Open each result, read its chart and checklist, and confirm the live price and the day's news before acting.

7. Gold & Silver

The Gold & Silver page shows today's international prices in Egyptian pounds, and lets you run your course method on each metal, exactly as for a stock.

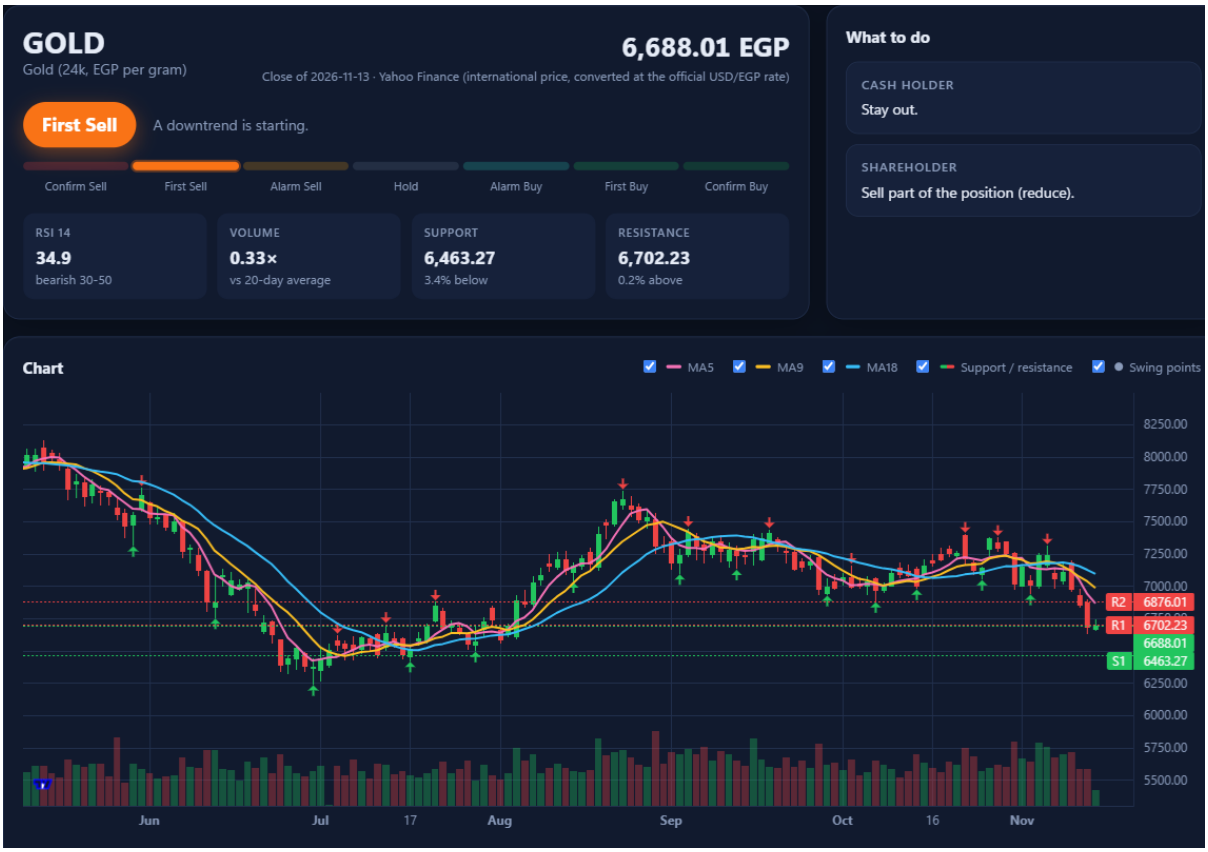

The Gold & Silver page: gold per gram for 24k, 21k and 18k, silver per gram, the dollar rate and the gold/silver ratio.

Card	What it shows
Gold	Price per gram for 24k, 21k and 18k in EGP, per ounce in USD and EGP, today's change, 1-year performance and 52-week range
Silver	Price per gram (999 silver) in EGP, per ounce, today's change, 1-year performance and 52-week range
Market	The official US dollar rate in EGP, and the gold/silver ratio

> **IMPORTANT** **International price, not the shop price**
> Prices come from the international gold and silver markets (Yahoo Finance), converted at the official dollar rate. Egyptian shops add a local premium and workmanship fees, so the 21k price at a jeweller is usually higher.

7.1 Analyse gold or silver with your course method

1. Click **Analyze with my course method** on the Gold or Silver card, or type **GOLD** or **SILVER** in the search box.
2. You get the same signal, chart, 11-step checklist and trade plan as for a stock, on the price in EGP per gram (24k gold, 999 silver).
3. The trade plan counts **grams** instead of shares. Key figures, the company rating and the combined view are hidden, because there is no company behind a metal.
4. Click **Add to watchlist** to scan gold and silver together with your stocks.

Gold analysed with the course method, in EGP per gram.

7.2 The gold/silver ratio

The ratio is how many ounces of silver one ounce of gold buys. Historically it moves roughly between 40 and 120. Above about 80, silver is cheap compared with gold; below about 50, gold is cheap compared with silver. It is a context indicator, not a buy or sell signal.

8. Stocks without price history (Import CSV)

Prices come from Yahoo Finance, which covers the larger, widely traded EGX stocks but not every company. If a stock isn't covered, you'll see "Yahoo Finance has no price history". You can still analyse it from a file of daily prices:

1. Export daily prices from your broker or a charting website as a **CSV** file, with at least 60 trading days (a year is best).
2. Type the stock code in the search box (optional, used as the name), then click **Import CSV** and choose the file.

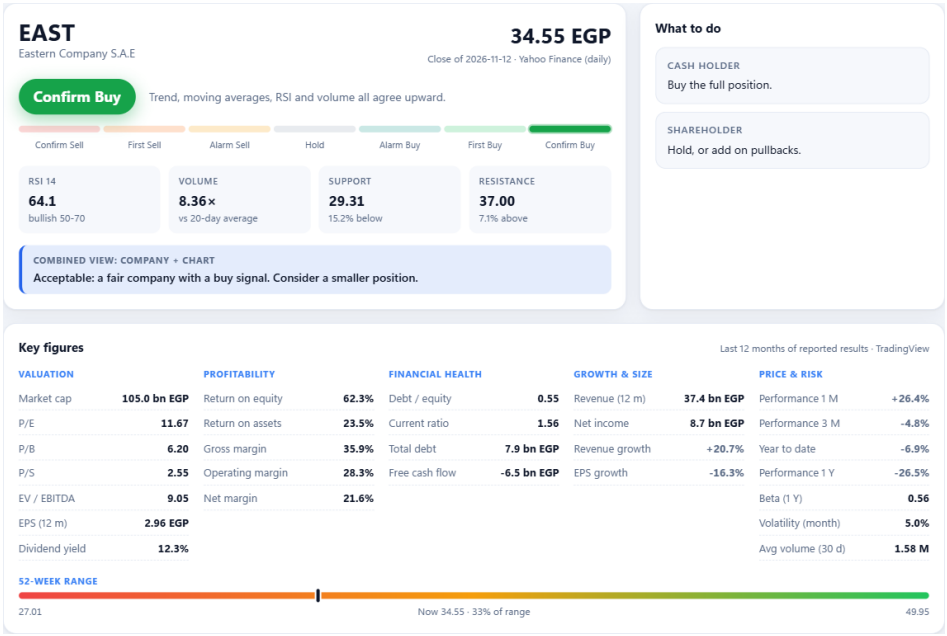

The file needs	Accepted forms
Date	2026-11-05, 05/11/2026 or 11/05/2026 (one style for the whole file)
Open, High, Low	Plain numbers; thousands separators like 1,234.5 are fine
Close	A column named Close, Price or Last
Volume (optional)	Volume or Vol.; values like 1.2M or 850K are understood

> **TIP** **Getting a CSV from Investing.com**
> On investing.com, open the stock, choose **Historical Data**, set the period to about one year and the time frame to **Daily**, then click **Download**. Beedo-Trade reads that file as it is: its Price and Vol. columns, volumes like 1.2M and its month/day dates. Investing.com doesn't allow programs to fetch its data automatically, so this download is the way to use it.

9. Settings, updates and data

9.1 Theme: dark, light or system

Click the **Theme** button at the bottom of the left menu to switch between **Dark**, **Light** and **System**. System follows the light or dark setting of Windows or macOS and changes with it.

Light theme (EAST, Confirm Buy).

9.2 What Beedo-Trade remembers

Your watchlist, cash, risk %, position (cash holder or shareholder) and theme are saved automatically in your user profile, in the folder %APPDATA%\BeedoTrade. The About page shows the exact folder.

9.3 Updating to a new version

1. On the **About** page, click **Check for updates**. This opens the GitHub Releases page.
2. Download the newer Beedo-Trade-Setup file and run it. It replaces the old version in place and closes Beedo-Trade first if it is open.
3. Your watchlist and settings are kept.

10. Uninstalling

Use either of the standard Windows ways:

A **From Windows Settings**
Open **Settings → Apps → Installed apps**, find **Beedo-Trade**, click the ··· button and choose **Uninstall**.

B **From the Start menu**
Open the Start menu, find **Uninstall Beedo-Trade** and click it.

At the end, Beedo-Trade asks whether to **also delete your settings and watchlist**. Choose **No** to keep them for a future install, or **Yes** to remove everything. The program, its shortcuts and this guide are always removed.

11. Troubleshooting

Problem	What to do
Setup: "Access is denied" (Error 5)	Choose "Install for me only" and keep the suggested folder, or choose "Install for all users" to install into Program Files (needs administrator approval).
"Windows protected your PC"	Click More info, then Run anyway. The app isn't code-signed.
The app window stays blank	Install Microsoft Edge WebView2 (free from Microsoft), then start Beedo-Trade again.
"Yahoo Finance has no price history"	Yahoo doesn't carry that stock. Use Import CSV (section 8).
"Could not reach Yahoo Finance"	Check your internet connection, firewall or VPN, then try again.
Prices look a day old	Free data can lag, and on Friday and Saturday the latest price is Thursday's close. Check the live price in your broker app.
Company rating says "Not enough data"	TradingView has too few reported figures for that company (common for smaller firms). Use the technical signal and keep positions small.
The first start is slow	Normal: Windows checks a new program the first time. Later starts are faster.

Still stuck? On the About page, click **Report a problem** to open an issue on GitHub, and describe what you did and what you saw.

> **IMPORTANT** **Not investment advice**
> Beedo-Trade applies a technical-analysis method for learning and decision support. It does not know your full financial situation and does not place orders. You make every decision.
